

## PhD in FISICA / PHYSICS - 38th cycle

Number of scholarship offered	20
Department	DIPARTIMENTO DI FISICA

### Description of the PhD Programme

The PhD Program aims at providing engineers and physicists with a general education in the basic areas of applied physics and specific knowledge in condensed matter physics, optics, lasers and photonics. To develop a research-oriented mind-set, the PhD students are guided to acquire problem-solving capabilities in a complex context, including in-depth problem analysis, identification of original solutions and capability of evaluating their applicability in given contexts. These skills will provide future doctors with major opportunities for their activities both in the academic field and in public and private companies and organizations.

The education contents are strictly related to the research activities carried out in the advanced experimental laboratories at the Department of Physics. In particular, 5 research lines can be identified:

- Ultrafast optics and spectroscopy: i) development of new nonlinear optics-based methods to generate broadly tunable pulses, from the infrared the extreme-ultraviolet, with duration down to single optical cycle limit (from a few femtoseconds to attoseconds); ii) application to the study of primary photoinduced processes in atoms, molecules and solid state materials.
- Solid state lasers and photonic devices: i) development of ultra-broad band solid-state lasers and amplifiers for optical frequency combs; ii) femtosecond laser micromachining of transparent materials for novel optofluidic devices and integrated quantum optical circuits; iii) theoretical investigation and design of optical nanostructures for sensing applications.
- Photonics for health, food and cultural heritage. Development of innovative photonic systems and techniques and application in interdisciplinary fields relying on non-invasiveness and high diagnostic potential of optical means (e.g., fluorescence or photon migration). Projects involve theoretical investigations and simulations as well as extensive experimental work, including development of advanced laboratory set-ups and dedicated prototypes for use in real settings.
- Epitaxial growth and nanostructure fabrication (Milano-Leonardo and Como): i) synthesis of artificial materials for microelectronics, optoelectronics, plasmonics and spintronics; ii) optical and electron beam lithography; iii) spectroscopy and microscopy; iv) SiGe/Si heterostructures; v) graphene nanoelectronic devices; vi) magnetic thin films, oxide thin films.
- Electronic, optical and magnetic properties of low-dimensional systems (Milano-Leonardo and international synchrotron radiation facilities): i) x-ray spectroscopies with synchrotron radiation;

ii) ultrafast magnetic and electronic phenomena; iii) positron annihilation spectroscopy, antimatter production (at CERN); iv) nano-optics and plasmonics.

The specific research subject will be assigned within the first months of the PhD activity, with the agreement of the candidate and the Board of Professors of the PhD Program.

Most research is integrated with the activities of the Institute of Photonics and Nanotechnologies of the National Research Council (IFN-CNR) and with the Interuniversity Center LNESS

(Laboratory of Epitaxial Nanostructures on Silicon and for Spintronics). Collaboration is also active with the IIT (Istituto Italiano di Tecnologia) Center for Nano Science and Technology.

Several collaborations are on-going with high-level international institutions, both universities and advanced research centers (e.g., University of Cambridge, Massachusetts Institute of Technology, Stanford University, University College London, Harvard University). Students enrolled in our PhD Program will therefore have a real opportunity to gain experience also in prestigious laboratories abroad.

The Department of Physics is home to the PhD Program. Further information on the PhD Program and related research activities can be found at: [www.fisi.polimi.it](http://www.fisi.polimi.it)

## PhD in FISICA / PHYSICS - 38th cycle

### THEMATIC Research Field: ADVANCED MICROSCOPY OF NANOSTRUCTURED INTERFACES AND 2D MATERIALS

Monthly net income of PhDscholarship (max 36 months)	
<b>€ 1300.0</b>	
In case of a change of the welfare rates or of changes of the scholarship minimum amount from the Ministry of University and Research, during the three-year period, the amount could be modified.	
Context of the research activity	
<b>Motivation and objectives of the research in this field</b>	Modern nano-fabrication techniques allow structuring of surfaces, far below the wavelength of visible light. The design and characterization of such metamaterials require sub-diffraction resolution microscopy. The thesis aims at investigating light-matter interaction at the nanoscale by means of advanced microscopy techniques. Modern nano-fabrication techniques allow structuring of surfaces, far below the wavelength of visible light. The design and characterization of such metamaterials require sub-diffraction resolution microscopy. The thesis aims at investigating light-matter interaction at the nanoscale by means of advanced microscopy techniques.
<b>Methods and techniques that will be developed and used to carry out the research</b>	Nano-imaging and nano-spectroscopy will be used to investigate light-matter interaction at the nanoscale, including excitons polaritons in 2D materials.
<b>Educational objectives</b>	Application of sub-diffraction limited microscopy.
<b>Job opportunities</b>	Developing new functionalities in nano-imaging microscopy and spectroscopy is constantly part of the research efforts of microscopes manufacturers. Moreover, the application to 2D materials open to new possibilities in the emerging field of flat lightweight electronics.
<b>Composition of the research group</b>	1 Full Professors 4 Associated Professors 4 Assistant Professors 3 PhD Students
<b>Name of the research directors</b>	Antonio Ambrosio

## THEMATIC Research Field: EDIBLE ELECTRONICS

Monthly net income of PhDscholarship (max 36 months)	
<p style="text-align: center;"><b>€ 1300.0</b></p> <p>In case of a change of the welfare rates or of changes of the scholarship minimum amount from the Ministry of University and Research, during the three-year period, the amount could be modified.</p>	
Context of the research activity	
<b>Motivation and objectives of the research in this field</b>	The emerging field of edible electronics is creating great scientific resonance by envisioning a technology which is safe for ingestion, environmentally friendly, cost-effective, and degraded within the body after performing its function, either digested or even metabolized. Long-term opportunities include smart pharmaceuticals and direct food tagging. We offer one scholarship in the framework of the European FET project "ROBOFOOD", where edible electronics will be applied to edible soft robots.
<b>Methods and techniques that will be developed and used to carry out the research</b>	The study will be performed within the "Printed and Molecular Electronics" group, led by Mario Caironi in the Center for Nano Science and Technology @PoliMi, of the Istituto Italiano di Tecnologia. The study will specifically focus on edible power supplies, in particular edible galvanic couples and batteries.
<b>Educational objectives</b>	Expanding the knowledge of the electronic and electrochemical properties of food and food derivatives, learning solution-based fabrication techniques, exploring the toxicological properties of synthetic carbon based materials, working in a multidisciplinary field.
<b>Job opportunities</b>	Edible Electronics is new multidisciplinary research field, providing a great opportunity to be exposed to several different environments, from academia to industry. Careers in academia, in industry, industrial R&D and consulting are possible.

## THEMATIC Research Field: INTEGRATED QUANTUM PHOTONIC PROCESSOR

Monthly net income of PhDscholarship (max 36 months)
<b>€ 1200.0</b>
In case of a change of the welfare rates or of changes of the scholarship minimum amount from the Ministry of University and Research, during the three-year period, the amount could be modified.

Context of the research activity	
<b>Motivation and objectives of the research in this field</b>	In the context of the EU FET-OPEN project with acronym PHOQUSING, the objective of the research activity is to develop reconfigurable integrated photonic circuits to be used as quantum processors in the next generation of Noisy, Intermediate-Scale Quantum (NISQ) devices
<b>Methods and techniques that will be developed and used to carry out the research</b>	Femtosecond laser micromachining of transparent materials to create the photonic circuits and photolithography of electrical circuits on the same chip to implement device reconfigurability. Vacuum packaging of devices. Photonic techniques to characterize, interface, and exploit the devices.
<b>Educational objectives</b>	Solid understanding of photonics and light-matter interaction. Hands-on training in femtosecond laser micromachining. Participation and presentation of the results at major international conferences. Writing of scientific articles.
<b>Job opportunities</b>	Post-doc opportunities in academia, both in Italy and abroad. R&D activity in high-tech companies.

## PhD in FISICA / PHYSICS - 38th cycle

### THEMATIC Research Field: INTEGRATION OF LED-FREE PIEZOELECTRIC MATERIALS IN MEMS

#### Monthly net income of PhDscholarship (max 36 months)

**€ 1400.0**

In case of a change of the welfare rates or of changes of the scholarship minimum amount from the Ministry of University and Research, during the three-year period, the amount could be modified.

#### Context of the research activity

##### Motivation and objectives of the research in this field

The research program will focus on the integration of lead-free piezoelectric materials on MEMS devices (sensors, actuators, energy harvesters, etc.). Given the regulatory standards of the European Commission on reducing the use of lead also in microelectronics, there is an urgent need to replace PZT, the piezo material widely used in MEMS, with innovative lead-free materials. However, there are currently no solutions compatible with industrial applications. The project aims to fill this gap by working in synergy with one of the major players in the MEMS field: STMicroelectronics.

##### Methods and techniques that will be developed and used to carry out the research

The candidate will work in a team made of a full professor, an assistant professor and a PhD student in the framework of the Joint Research Centers STEAM between Politecnico di Milano and STMicroelectronics. Experimental activities will be carried out in Polifab ([www.polifab.polimi.it](http://www.polifab.polimi.it)). In particular the candidate will work on a new, fully automatized cluster tool for confocal sputtering on 8" wafers, equipped with two chambers for functional oxides and metals. The following activities are foreseen: (i) identification of emerging lead-free materials compatible with silicon processes in cooperation with DFT theoreticians; (ii) syntheses of piezoelectric films by PVD processes on 8" wafers; (iii) film characterization, (iv) integration in MEMS prototypes.

##### Educational objectives

Development of interdisciplinary knowledge at the boundary between physics, microfabrication technology,

	micromechanics and electronics.
<b>Job opportunities</b>	This activity will be carried out within the Joint Research Center of STM and Politecnico di Milano (MEMS lab), in strong connection with the world of MEMS development and production. This PhD will represent a solid basis for careers both in academia and in MEMS industry.

## PhD in FISICA / PHYSICS - 38th cycle

**THEMATIC Research Field: LAB-ON-A CHIP FOR BIO-APPLICATIONS - PHOTONICS MEETS MICROFLUIDIC AND LIFE SCIENCE**

Monthly net income of PhDscholarship (max 36 months)
<b>€ 1300.0</b>
In case of a change of the welfare rates or of changes of the scholarship minimum amount from the Ministry of University and Research, during the three-year period, the amount could be modified.

Context of the research activity	
<b>Motivation and objectives of the research in this field</b>	The World Health Organization has put forth ambitious milestones moving toward an early stage detection of high social impacts diseases. In this framework, Photonics in combination with Lab-on-a-chip technologies provide a key pathway towards the development of a automatic, portable, high-sensitivity and affordable diagnostic platform, as well as key tools to be able to simulate the behavior of 2-3D cellular systems (up to organ mimicry - 3D Scaffolds) already at the laboratory stage. In particular, this approach allows to study, almost in real time, the cells response to light stimuli and/or drug delivery. Nano science and technology are at the forefront of such activity. They are also involved in humanoid technology and the development of new organ-on-a-chip. The main objective is innovation, exploiting new knowledge in proof of concepts devices. <a href="http://cnst.iit.it/">http://cnst.iit.it/</a>
<b>Methods and techniques that will be developed and used to carry out the research</b>	Femtosecond Laser Micromachining; Hybrid wet etching; Co2 laser polishing; Inkjet printing; Raman Spectroscopy; Manufacture and optimization of integrated Optofluidic "Lab on a chip" devices for various bio-photonics application: liquid biopsy, study of mechanical properties of cells in real time and/or subjected to external stimuli ( optical, electrical and magnetic). Cell-lines management.
<b>Educational objectives</b>	The topic is highly interdisciplinary. The main outcome is a trans-disciplinary language that able to provide useful skills and tools to push forward Lab-on-a-chip / Organ-on-a-chip frontier research, while keeping a physical and

	photonic engineering solid base.
<b>Job opportunities</b>	Academic, Research institutes. Engineers, physics, research or technical managers in high-tech industry: Optics&Photonics, Bio Photonics Companies, Microfluidic, Lab on a Chip manufacturing, Bio Tech R&D, Electronics devices, biomedical engineers, smart packaging (serialization and anticounterfeiting) and QC on Pharmaceutical industry.

### THEMATIC Research Field: NANO MATERIALS FOR THE NEW GENERATION HUMAN MACHINE INTERFACE

#### Monthly net income of PhDscholarship (max 36 months)

**€ 1300.0**

In case of a change of the welfare rates or of changes of the scholarship minimum amount from the Ministry of University and Research, during the three-year period, the amount could be modified.

#### Context of the research activity

##### Motivation and objectives of the research in this field

Evolution in human-machine interface requires the use of bio-compatible, bio-mimetics and functional materials, with high performance also in terms of durability and robustness, and the understanding of complex interface mechanisms taking place between the abiotic and biotic realms. The proposed activity concerns the characterization of nano-materials (nanoparticles, molecular aggregates, fibrillis) that can be used to develop interfaces; the study of interface model systems; the realization of hybrid systems. The project has broad implications in the world of robotics and life science. In particular, they could lead to revolutionary applications in fields such as prostheses (see the retinal prosthesis developed by our laboratory <https://www.novavido.it/it/>), the treatment of paralyzed patients or patients who have undergone amputations and soft robotics.

##### Methods and techniques that will be developed and used to carry out the research

Spectroscopy: steady state absorption and emission; time resolved photoluminescence and pump-probe. Spettro-electro-chemistry. 3D bio printing, other deposition techniques for fabricating hybrid samples. Electrophysiology on cell-lines.

##### Educational objectives

The topic is highly interdisciplinary. The main outcome is a trans-disciplinary language and the understanding of multi-scales problems, while keeping a photophysics solid base.

##### Job opportunities

## PhD in FISICA / PHYSICS - 38th cycle

### THEMATIC Research Field: NANOSTRUCTURING QUANTUM MATERIALS FOR NANO-ELECTRONICS AND SPINTRONICS

#### Monthly net income of PhDscholarship (max 36 months)

**€ 1250.0**

In case of a change of the welfare rates or of changes of the scholarship minimum amount from the Ministry of University and Research, during the three-year period, the amount could be modified.

#### Context of the research activity

##### Motivation and objectives of the research in this field

Controlling at the nanoscale the magnetic, transport and optical properties of quantum materials enables the study of new phenomena and the realization of complex functionalities for next generation devices. The research aims to employ a technique called  $\lambda$  phase nanoengineering  $\lambda$  for producing highly controlled changes in the phase, defectosity or surface chemistry of thin films. This will in turn allow to tune their transport and magnetic properties. The technique will then be used for realizing artificial nanomaterials and devices with enhanced functionality. The research activity is part of the H2020-ERC-2020-Stg:  $\lambda$  Beyond Nanofabrication via nanoscale phase engineering of matter (B3YOND - GA 948225)  $\lambda$

##### Methods and techniques that will be developed and used to carry out the research

Growth of thin film multilayer structures via magnetron sputtering. Nanoscale surface characterization of the morphology, electric and magnetic properties via Scanning Probe Microscopy. Conventional Nanofabrication techniques, e.g. optical lithography, e-beam lithography, ion milling. Advanced Nanofabrication via thermal scanning probe lithography and direct UV laser writing. Magnetic characterization via Kerr microscopy, vibrating sample magnetometer and synchrotron-based techniques. Electronic transport measurements: Magnetoconductance, Hall measurements. Cryogenic transport measurements in cryostat. Numerical methods: Micromagnetic simulations and Finite Elements Method simulation of electronic and thermal transport.

<b>Educational objectives</b>	Understanding of electronic transport and magnetism in nanostructured quantum materials. Training in cleanroom techniques, nanoscale measurements, transport measurements and micro-nanofabrication methods. Participation and presentation in local and international workshops and conferences. Writing of scientific articles and proposals.
<b>Job opportunities</b>	Post-doc opportunities in academia both in Italy and abroad. R&D positions in companies, universities and research centers in Italy and abroad. Managerial positions in the field of innovation and technology

## PhD in FISICA / PHYSICS - 38th cycle

### THEMATIC Research Field: PRINTED ELECTRONICS FOR RADIO FREQUENCIES

Monthly net income of PhDscholarship (max 36 months)	
<b>€ 1300.0</b>	
In case of a change of the welfare rates or of changes of the scholarship minimum amount from the Ministry of University and Research, during the three-year period, the amount could be modified.	
Context of the research activity	
<b>Motivation and objectives of the research in this field</b>	<p>Printed Electronics is an emerging field, aiming at fabricating large-area, flexible and lightweight circuits by means of scalable printing techniques. Applications are broad, from wearable micro- and opto-electronic systems, to Internet of Things, and biocompatible, and even edible, devices for human body sensing. In this context, solution-processable organic semiconductors are one of the most promising options. However, to date, printed organic electronics fail in meeting the minimum requirements for being adopted in many wireless applications where operation in the the Ultra-High Frequency (UHF) bandwidth is necessary. Several fundamental aspects of the electronic properties of printed organic semiconductors (charge transport, injection, doping) have to be clarified and implemented in UHF electronic devices. A PhD in this area will tackle both the challenges of developing new high performance printed devices, to the deep understanding of the device physics to boost the development of the field.</p>
<b>Methods and techniques that will be developed and used to carry out the research</b>	<p>The study will be performed within the “Printed and Molecular Electronics” group, led by Mario Caironi in the Center for Nano Science and Technology @PoliMi, of the Istituto Italiano di Tecnologia. The study will require the development of suitable architectures and printing protocols of high-performance electronic devices, mainly transistors, derived from a deep understanding of organic device physics.</p>
<b>Educational objectives</b>	Expanding the knowledge of the electronic properties of

	printed organic semiconductors, learning solution-based and printing fabrication techniques, deep insight in device physics, working in a multidisciplinary field.
<b>Job opportunities</b>	Printed Electronics is a worldwide expanding field, with several growing opportunities worldwide, particularly in EU and also in Italy. Careers in academia, in printed electronics industry, industrial R&D and consulting are possible.
<b>Composition of the research group</b>	1 Full Professors 3 Associated Professors 6 Assistant Professors 9 PhD Students

## PhD in FISICA / PHYSICS - 38th cycle

### THEMATIC Research Field: SPETROSCOPIC INVESTIGATIONS OF QUANTUM TRANSITION- METAL FLUORIDES

#### Monthly net income of PhDscholarship (max 36 months)

**€ 1195.0**

In case of a change of the welfare rates or of changes of the scholarship minimum amount from the Ministry of University and Research, during the three-year period, the amount could be modified.

#### Context of the research activity

##### Motivation and objectives of the research in this field

The project Prin2020 QT-FLUO (ID 20207ZXT4Z) addresses a modern and challenging class of compounds which are transition metal fluorides (TM<sub>2</sub>FLUO). The interest of TM-FLUO derives from the prediction that AgF<sub>2</sub> based compounds, given their remarkable similarities with CuO based superconductors, should show superconducting behavior and exotic quantum magnetism. AgF<sub>2</sub> based compounds have therefore become subject of a recently funded national PRIN project "Quantum Transition-metal FLUORides (QT-FLUO)" for the preparation and characterization of AgF<sub>2</sub> based compounds. Among the characterization techniques the applying group will focus on studies of Resonant Inelastic X-Ray Scattering and Time<sub>2</sub>resolved ARPES. A team of chemists, expert in fluorination procedures will be responsible for the preparation of the highly reactive AgF<sub>2</sub> samples. The successful candidate will be mainly involved in the spectroscopic investigations, but in close contact and collaboration with the preparation team, to be aware of all aspects of these fascinating compounds.

##### Methods and techniques that will be developed and used to carry out the research

Time Resolved-ARPES will be performed to study fluorinated TMs samples to detect the evolution of the bands as the system is fluorinated. The time resolution of the setup (50 fs) allows a straightforward separation of electronic and phononic degrees of freedom taking place during the relaxation process induced in pump-probe experiments. RIXS is an energy loss spectroscopy that gives direct access to crystal field, charge transfer and

	spin excitations. Its measurement at the Ag L <sub>3</sub> edge or fluorine K edge can determine the main parameters involved in magnetic and charge excitations. RIXS experiments will be carried out at the ESRF (Grenoble) and DLS (Oxford).
<b>Educational objectives</b>	The student will learn the physics of quantum materials through advanced spectroscopy studies. She/he will become expert of soft x-ray resonant spectroscopy, inelastic scattering, resonant elastic scattering, pump-probe experiments with x-rays, time- and angle-resolved photoemission. All aspects of experiments will be considered: experimental planning, data collection, data reduction and analysis, interpretation also through model calculations.
<b>Job opportunities</b>	RIXS and TR-ARPES are among the most modern and challenging spectroscopic methods for solids. A scientist skilled in one of these techniques can be highly sought for research positions thanks to her/his expertise. The technical knowledge involved in the experiments will make the successful Ph.D student an interesting candidate also for highly technological industries.

*Educational activities per year :*

**1624,30 euros per student for each year.**

*Teaching assistantship:*

There are various forms of financial aid for activities of support to the teaching practice.

The PhD student is encouraged to take part in these activities, within the limits allowed by the regulations.

*Computer availability:*

1st year: *individual use*

2nd year: *individual use*

3rd year: *individual use.*

*Desk availability:*

1st year: *individual use*

2nd year: *individual use*

3rd year: *individual use*

## PhD in FISICA / PHYSICS - 38th cycle

**THEMATIC Research Field: ULTRAFAST NEAR- AND MID-INFRARED FIBER LASER FOR  
HYPER SPECTRAL VIBRATIONAL MICROSCOPY APPLIED TO HISTOPATHOLOGY AND  
PRECISION MEDICINE**

### Monthly net income of PhDscholarship (max 36 months)

**€ 1195.0**

In case of a change of the welfare rates or of changes of the scholarship minimum amount from the Ministry of University and Research, during the three-year period, the amount could be modified.

### Context of the research activity

#### Motivation and objectives of the research in this field

The main goal of this project is the development of innovative laser sources generating ultra-short pulses in the spectral region between 1 and 3  $\mu\text{m}$  with all-fiber-laser technology for applications to vibrational hyperspectral microscopy for medical diagnostics. Microscopy is a crucial tool in the biological field and in medical diagnostics. For the analysis of biological tissues, microscopy requires preparatory activities on the samples, such as labeling, to allow their functional characterization, at the expense of irreversible sample degradation. The possibility of carrying out a functional microscopy on untreated, label-free samples, would allow to speed up tissue analysis and would open the possibility of real-time investigation of live samples and fragile biological systems. In this context, vibrational spectroscopy is widely recognized as a universal tool for the identification of molecular compounds in chemical and biological samples based on their selective response to light. The hyperspectral techniques that will be investigated within this project are direct vibrational spectroscopy methods (based on the use of fiber lasers in the mid infrared) and non-linear coherent Raman microscopy (through the use of two-color synchronized all-fiber lasers in the near-infrared).

#### Methods and techniques that will be developed and used to carry out the research

In collaboration with the start-up company CRI s.r.l., a spin-off of Politecnico di Milano, the scholar will develop ultrafast optical techniques (design, construction and

	characterization of ultrafast fiber-lasers working in the near- and mid-infrared) as well as mid-infrared spectroscopy techniques and nonlinear microscopy techniques (stimulated Raman scattering, second-harmonic generation and two-photo-excited microscopy).
<b>Educational objectives</b>	The scholar will receive a multidisciplinary training in topics including laser physics, nonlinear optics, vibrational spectroscopy, biomedical optics and microscopy. He/she will be exposed to steps required for the industrial development of a deep-tech instrument such as the coherent Raman microscope by the company CRI s.r.l..
<b>Job opportunities</b>	Due to the multidisciplinary training in cutting edge techniques of optics and photonics as well as vibrational spectroscopy and biomedical optics, the scholar will have excellent job opportunities in high-tech industries. In addition, he/she will be well positioned for an academic career.
